

Courtside App: Troubleshooting?

Last Modified on 11/10/2022 3:00 pm AEDT

If you are having issues with the Courtside app mainly in terms of the app crashing there are some troubleshooting steps you can take before coming to our support team- if you are a Basketball Australia association please go through your state body or BA support team first:

ISSUES WITH UMPIRE CODES

If you are having issues with **umpire codes**, then it is possible the code is no longer active for the current season (as your registered season for the referee may not match the season your current comps are in) so check and run the [season umpire code report](#) to ensure these are still active. If still active retry the codes again in the app (make sure it has the most up to date version) or you try to register/manually add a new umpire to generate a new code at your association level - make sure they have a club record as well. Sometimes a new code can kick in a refresh.

If your games are currently in progress and you "generate" new umpire codes then these new codes won't work as the app hasn't been able to "refresh" to link those new codes to the app, so you will need to exit the app completely and jump back into it, which has allowed it to "refresh". We recommend making note of team and player scores before doing this.

ISSUES WITH PLAYERS NOT SHOWING

If **players are not feeding through to the app** it may mean that have not been assigned at team level within the database for that team so will not feed through. Or they may also not be registered for the current season at club and/or association level - check to make sure they are registered at both levels and are listed at team level.

APP CRASHES

If the **app continues to crash** this may mean you don't have the most recent version of the app so check your app store, it is possible the device you are using is on the older end of the scale and will not work with the app anymore (which unfortunately we can't control) or your devices recent software update has caused the app not not work properly. See the steps below related to troubleshooting in regards to the app crashing:

[Device specifications and information](#) for the app and to see what current version is released for the app.

Please try the following troubleshooting:

1. Check that your are connected to either WI-FI, MOBILE INTERNET or an ETHERNET CABLE.
2. Check the App store to ensure you have the most recent version of the app.
3. Check your device's settings for a software update to make sure you have the most recent version off the

software for the device.

NOTE FOR ANDRIOD DEVICE USERS

Although we recommend the device software is up to date we have come across a couple of random cases where the latest download android software itself has caused the app to not work correctly so try and undo the last device software update (will be your IT person question on how to do this or Google search) to see if that fixes the issue. If it does not resolve then reupdate to the latest version and follow the rest of the troubleshooting.

4. Uninstall and reinstall the app

5. If you have tried all the following and the app still crashes then it will most likely be the issue is with the device you are currently using:

GameDay recommend that only those android and iOS devices and operating systems that are **no more than 3 years old** are compatible with Courtside. A list of current devices that can be used can be [found here](#).

It is recommended that these devices are purchased based on their compatibility to that of the most recent version of the operating system released- you can Google search the name of your device to determine when it was released if you are unsure. If it is older than 3 years old then you will need to upgrade your device and we cannot do anything to assist - as we need to remain up to date with recent releases from Apple and Android, making changes to the app to suit specific tablets/ipads doesn't allow us get approved by these softwares, which unfortunately is out of our control.

If your device is less than 3 years old and has the most recent version of the app, please send through an email to support with the following details:

- outline of what issue is occurring (with screenshots or video as reference if possible)
 - screenshot of app version (located in admin/settings tab within the app)
 - if crashing is the issue then the app version should be listed in the app store so screenshot that
 - device name (e.g iPad Air)
 - ios/android operating version of device (e.g ios 15.1, android 12)
-
